Abstract of the disclosure

A method of and an apparatus for determining a value of a skin characteristic for application of permanent make-up or tattooing to the skin

The invention relates to a method of and an apparatus for determin-5 ing a value of a skin characteristic, especially of a type of skin, for the application of permanent make-up or tattooing to the skin. The method comprises the following steps: generating light rays (2) by means of a light source (1); irradiating a test sector (3) of a skin (4), to which tattooing or permanent make-up is to be applied 10 by means of color, with the light rays (2); measuring test light rays (5) formed in the test sector (3) by irradiation with the light rays (2), by a detector means (6) to generate measured electrical test light values of the test light rays (5); processing the measured electrical values by an electronic processing means (7) to de-15 termine a characteristic value which is a measure of a characteristic of the skin (4) in the test sector (3) and which is to be taken into account when applying permanent make-up or tattooing to the skin (4); and outputting the characteristic value via an output means (8). 20
